

# Ontologies on the web; current uses

Robert Warren\*

rhwarren@uwaterloo.ca

University of Waterloo

Joint work with Chris Baker, Greg Butler and Volker Haarslev.

\* Work done while at the Fungal Web Project, Concordia University

# Outline

- How many ontologies are really out there?
- What are they being used for?
- What are people doing with them?
- How complicated are they? Are these still research toys?

# Ontologies over time

# Changes to available ontologies.

# Ontology Publishers.

# Amount published.

# Ontology topics (ad hoc)

# Amount of data per topic.

# Evaluating Ontologies: Complexity

$$\text{Complexity} = \frac{\text{Number of classes}}{\text{Number of class modifiers}}$$

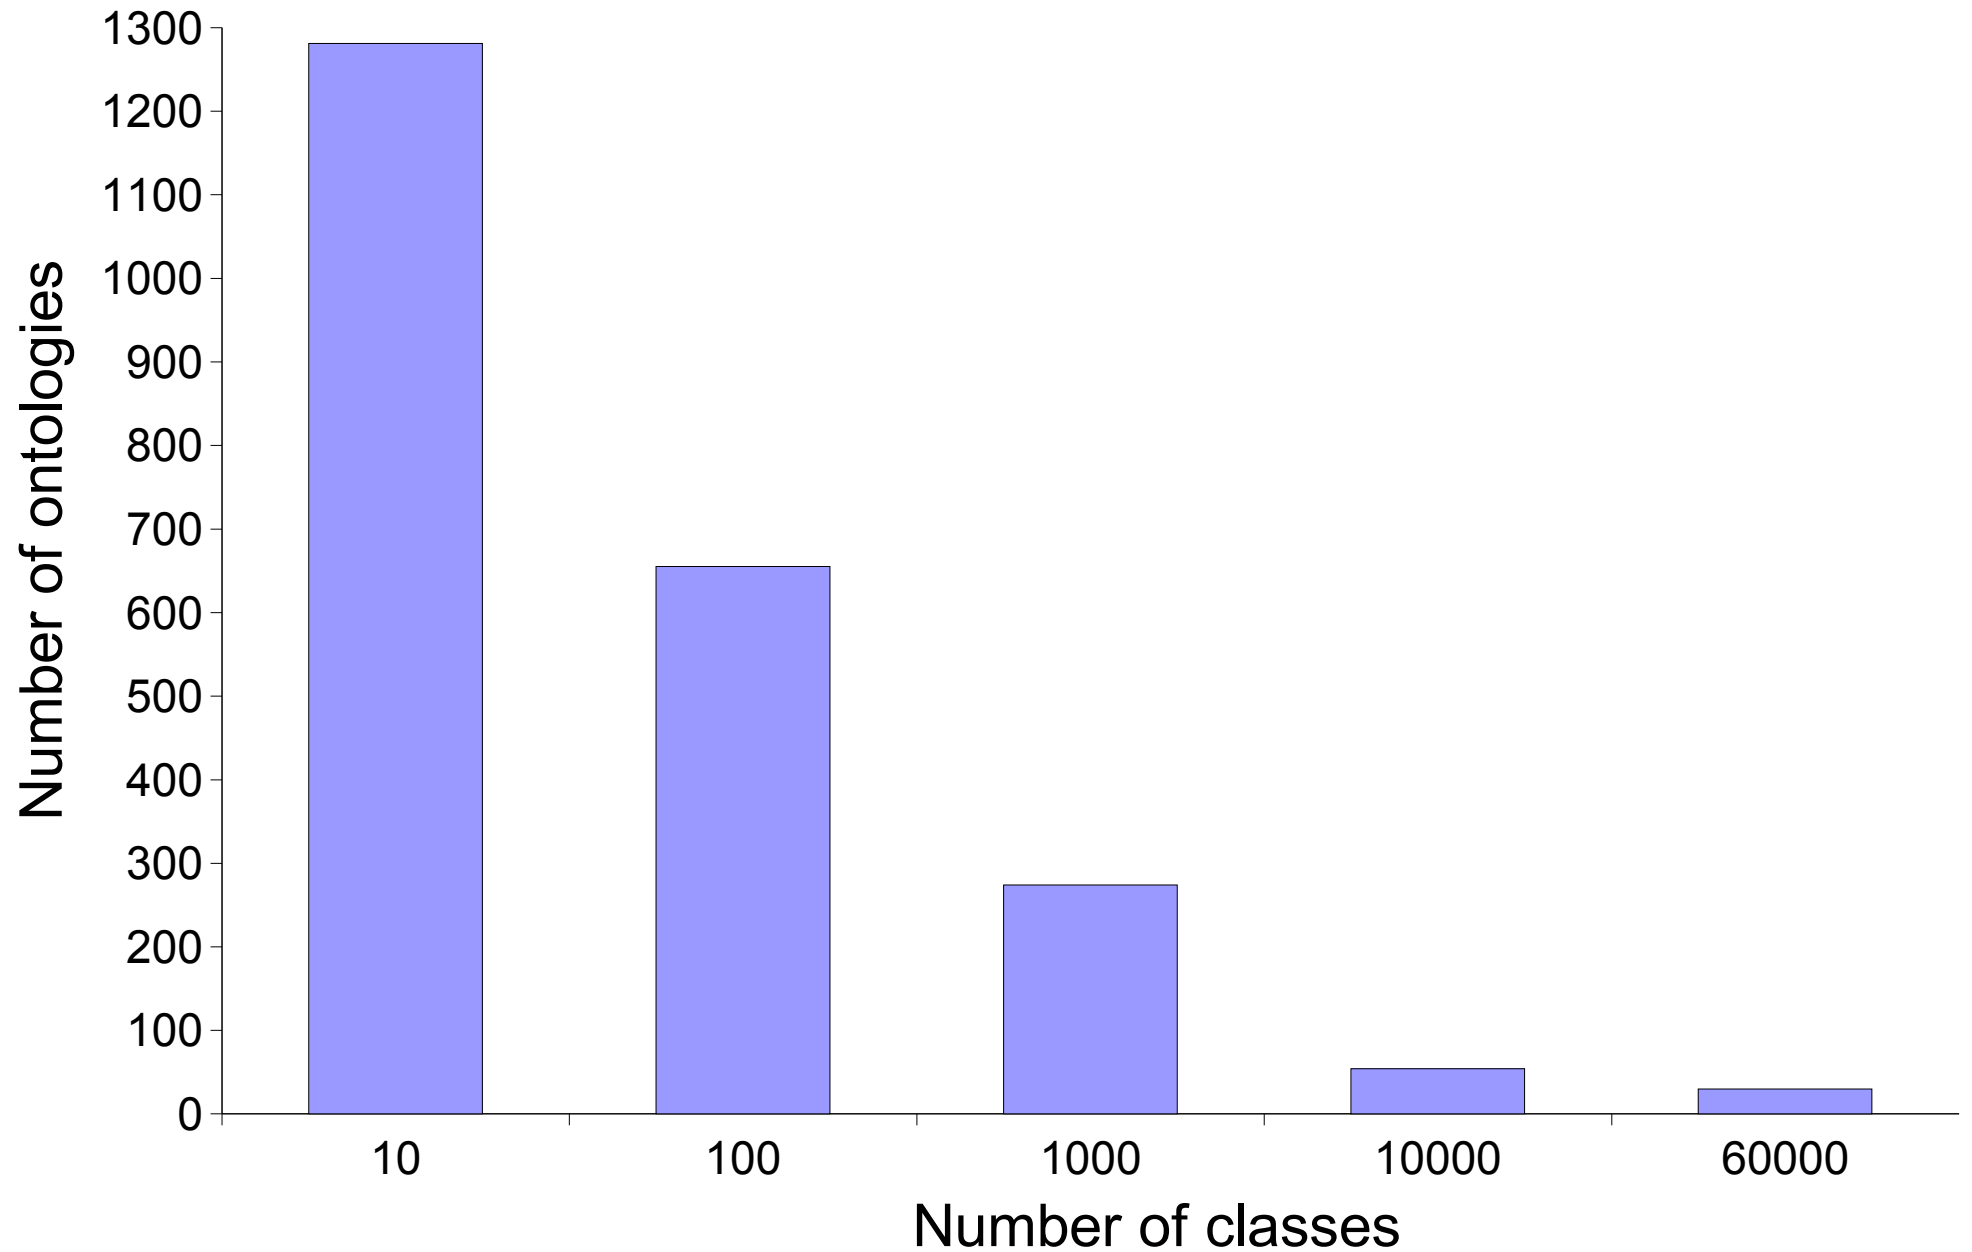

# Topic complexity.

# Average complexity over time

# Ontology size.

# Notes and Observations

- Scaling is still an issue for tools.
- Ontology use growing in scope and scale, but not in complexity.
- Data integration are already being (re)created.  
(But there is hope)
- Ontology evaluation needs further work.

# Conclusion

- Still early in the adoption of the technology.
  - Limited production in bio-medical domain for simple data exchange.
  - Limited production use in web services for service definition.
- Many engineering issues to be solved.
- Ontology and metrics list is available at:
