

# **EVOLUTIONARY SERVICE-ORIENTED ARCHITECTURE**

e-SOA in the Military Health System

---

Erick Peters MBA PMP  
InterSystems Corporation

# A {NOT SO} UNIQUE PROBLEM

---

- ✖ Creating a service framework around monolithic legacy systems presents unique challenges:
  - + Proprietary, closed architectures
  - + Users expectation of continuity
  - + Mature, functioning systems
  - + Previously developed point to point interfaces
  - + Enterprise in motion-dynamic

# AGENDA

---

- ✖ The SOA Revolution
- ✖ Why e-SOA
  - + The Decoupling Challenge
  - + The Cohesion Challenge
  - + The Evolution Requirement
- ✖ Understanding the Military Health System(MHS) Enterprise
  - + System(s) Architecture
  - + Information Exchange
  - + The Dilemma
  - + The COTS Approach
  - + The Current Approach
- ✖ From Concept to Implementation
  - + Choosing the tool(s)
  - + E-SOA Business Drivers
- ✖ Question and Answer

# THE SOA REVOLUTION

---

# SOA REVOLUTION

*"Sometimes I lie awake at night, and I ask, 'Where have I gone wrong?' Then a voice says to me, 'This is going to take more than one night.'"*

-Mr. Charles Brown

# SOA-THE TECHNOLOGY PART

The technical implementation of services is **NOT** the biggest challenge facing established enterprises...

# REVOLUTION OR EVOLUTION

# WHY E-SOA

---

# THE DECOUPLING CHALLENGE

- ✖ Migrate from disparate systems or traditional enterprise architectures
- ✖ Separate components and code without breaking the system
- ✖ Create new, sensible, extensible, reusable components

# THE COHESION CHALLENGE

- ✖ Maintain the semblance of one system
- ✖ Infinite sub-services create a single system interaction experience for the end user
- ✖ New components must blend seamlessly with legacy components

# THE “EVOLUTION” REQUIREMENT

- ✗ Decades old legacy system
- ✗ Ongoing system changes
- ✗ Irreplaceable business rules
- ✗ Continuity of operations
- ✗ Regulatory/legal compliance
- ✗ Other systems in flux:
  - + Longitudinal Health Record (AHLTA)
  - + Procurements

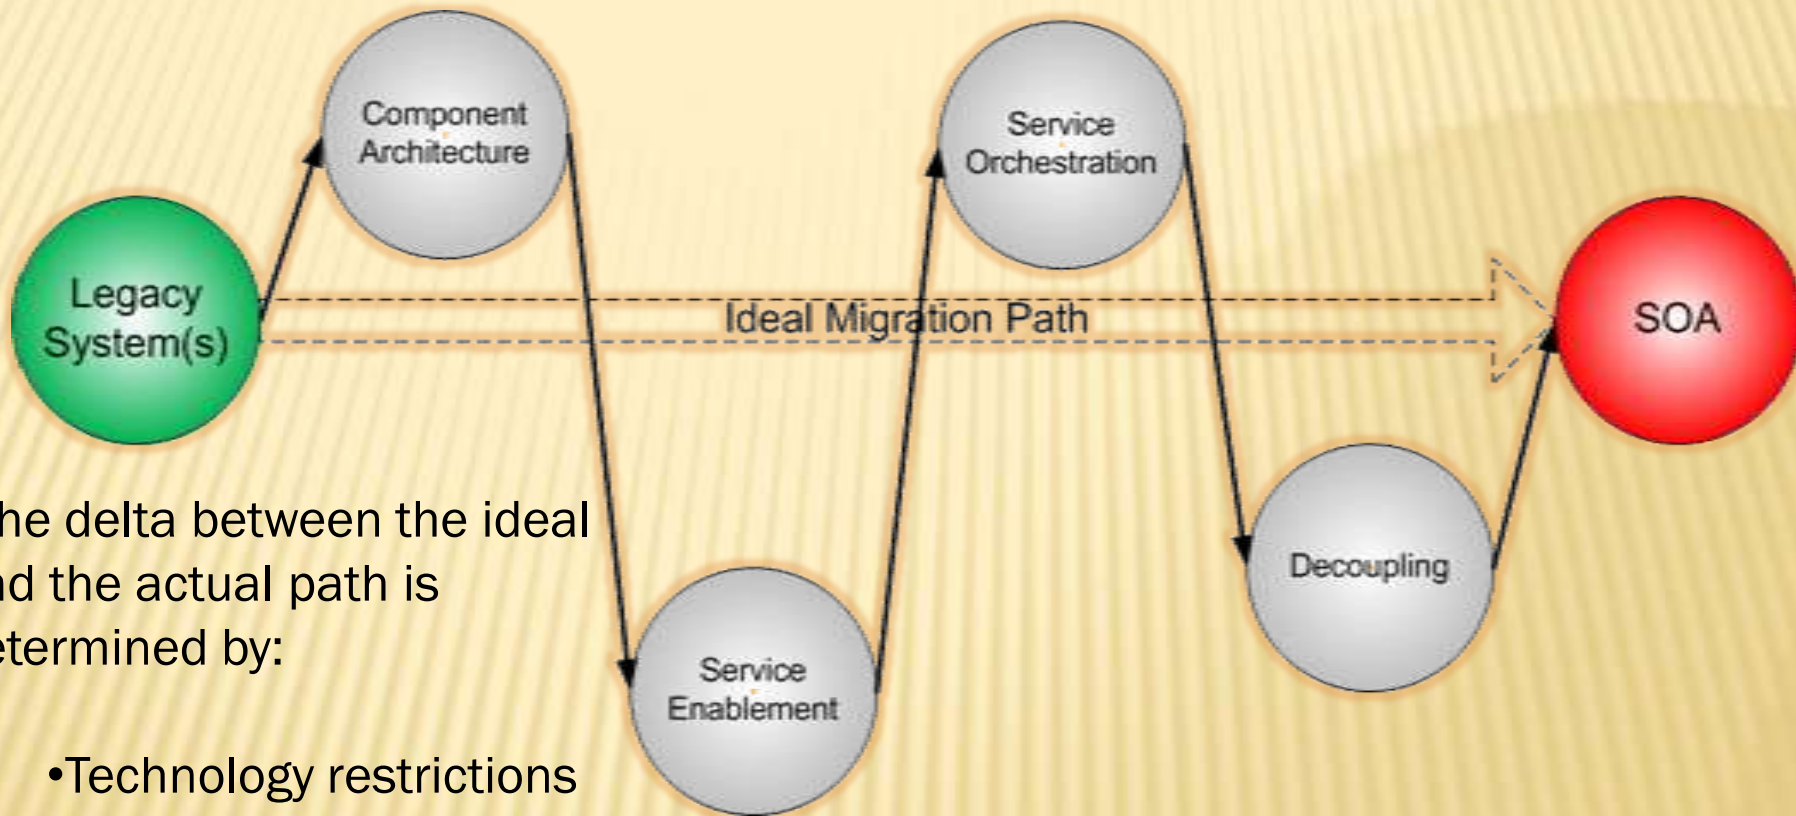

- Synonyms **1.** unfolding, change, progression, metamorphosis.
- Antonyms **1.** stasis, inactivity, changelessness.

—Antonyms **1.** stasis, inactivity, changelessness.

# THE EVOLUTION

•The delta between the ideal and the actual path is determined by:

- Technology restrictions
- Budget constraints
- Risk tolerance
- Timeline requirements

# UNDERSTANDING THE MHS ENTERPRISE

# MHS SYSTEMS OVERVIEW

# MHS INFORMATION EXCHANGE-LEGACY

- ✗ Historical 'one-off' development
- ✗ Hundreds of point-to-point interfaces
- ✗ Extreme coupling
- ✗ Expensive maintenance and sustainment

# MHS INFORMATION EXCHANGE-GOAL

- ✖ Single unified service engine based on JSR 208
- ✖ Service enablement
- ✖ Service orchestration
- ✖ Message normalization
- ✖ Guaranteed delivery
- ✖ Binding specifications

# MHS INFORMATION EXCHANGE-REALITY

- ✖ Composite HealthCare System (CHCS)
  - + Dominates the MHS landscape
  - + A system of systems
  - + Developed over 15 years
  - + Digital Standard MUMPS
  - + Built in interfacing (HL7 and EDI)

# MHS SOA -THE DILEMMA

How to evolve from  
monolithic legacy to  
open SOA

- ✗ Dominant master system
- ✗ Highly coupled
- ✗ Legacy language (DSM)
- ✗ Closed architecture
- ✗ Federated, stand-alone instances

# THE COTS APPROACH

- ✖ Modularize the legacy system
- ✖ Replace modules incrementally
- ✖ Integrate COTS modules
- ✖ Evolve legacy to obsolescence and retirement

# THE COTS CHASM

- ✖ Requirements gap
  - + Commercial practices and government requirements
  - + Mature, accepted, and adopted business rules
  - + Regulations, policies, and instructions
- ✖ Configuration costs
  - + Customization of code
  - + Customization of interfaces (integration and user)
  - + Total Cost of Ownership during modular transition

# THE CURRENT APPROACH

---

## ✗ Keys to success

- + Migrate to standards-based, open-architecture
- + Decouple functionality within the core system
- + Service enable core functionality

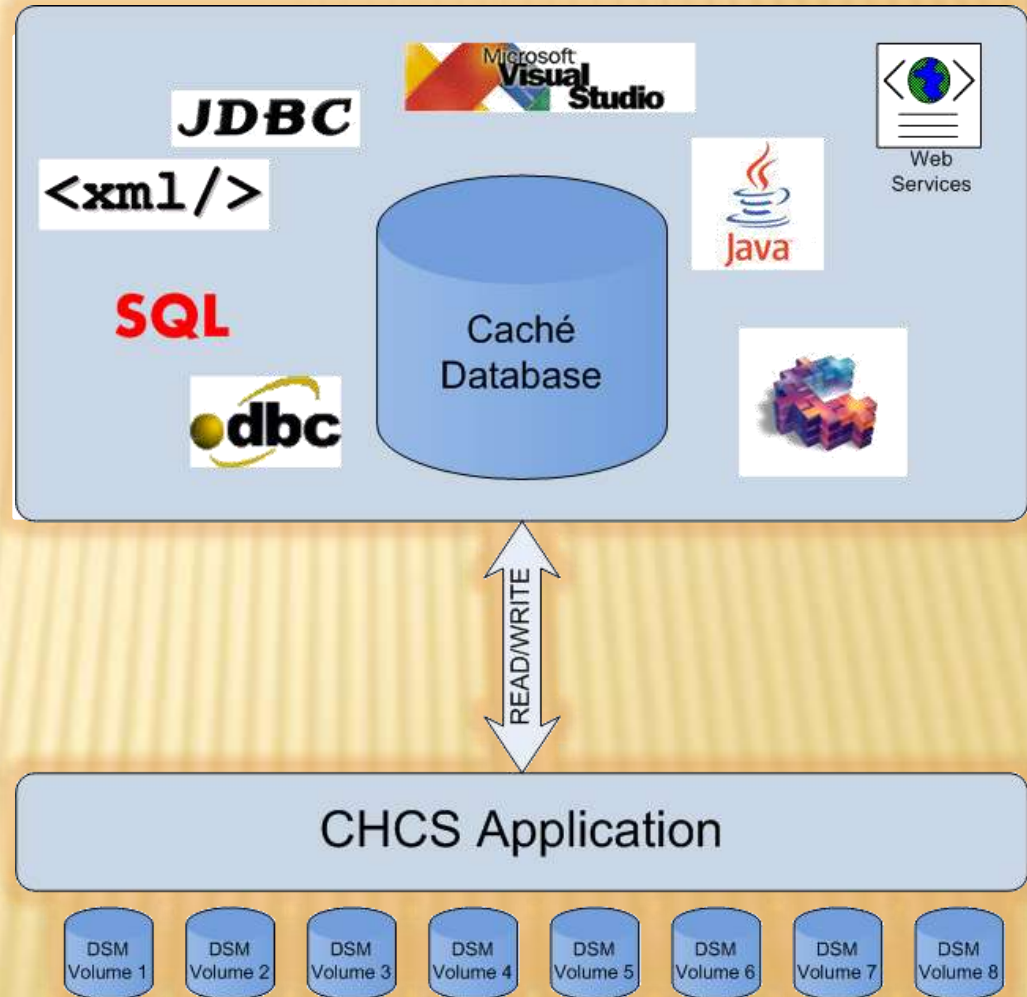

## ✗ Architectural decisions

- + Service interrelations and orchestration
- + Common files and functions (the plumbing)
- + Modular decomposition

# STANDARDS-BASED OPEN ARCHITECTURE

- ✖ 3,300+ Caché Classes:
- ✖ 3,300+ SQL Table
- ✖ 3,300+ Caché Objects
- ✖ 45,500+ SQL/Object Triggers
- ✖ 150,000+ Data Elements

- ✖ 3,300+ Fileman Files
- ✖ 45,500+ Triggers
- ✖ 80+ DSM Globals
- ✖ 150,000+ Data Elements

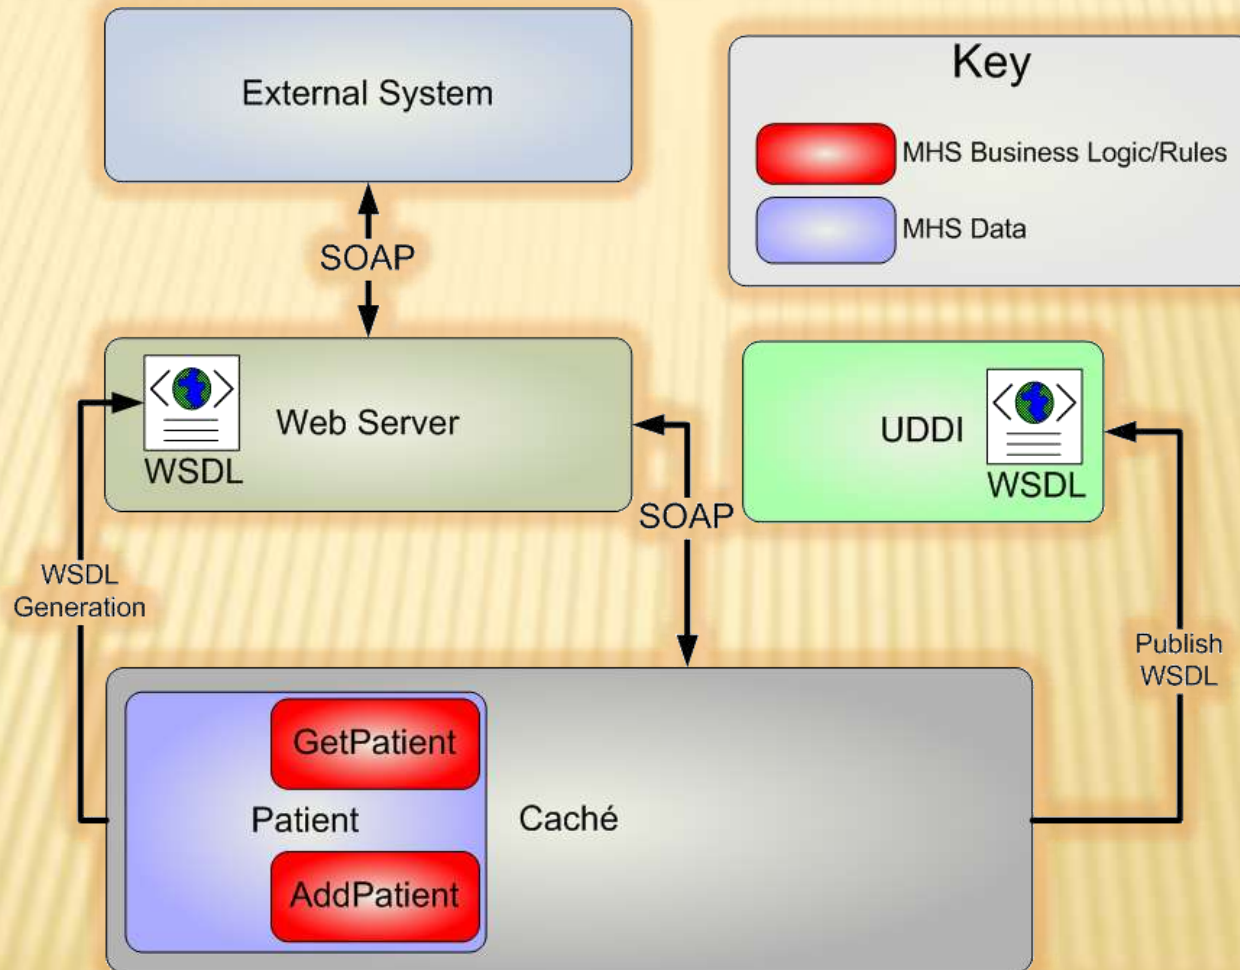

# DECOUPLING FUNCTIONALITY

- ✗ Segregation of modules may not be absolute
- ✗ Orchestration of services is key
- ✗ Avoid service redundancies

# SERVICE ENABLEMENT OF LEGACY

Service Enable Core Functionality

# NEXT EVOLUTIONARY STEP

- ✖ Service orchestration
- ✖ UDDI
- ✖ Interoperability
- ✖ Extending the enterprise

# FROM CONCEPT TO IMPLEMENTATION

---

# E-SOA TOOLS SELECTION

## ✖ Agile

- + Able to change course frequently with little adverse impact to cost/risk/schedule

## ✖ Technology absorption

- + Readily integrated into YOUR technology enterprise
- + Extensibility/interoperability/trainability/maintainable

## ✖ Rapid Application Development

- + Able to deliver phased, deployable results
- + Empowers long term vision
- + Lowers project risk

# E-SOA BUSINESS DRIVERS

---

- ✖ Require the cost, speed, scalability, flexibility benefits of SOA
- ✖ Cost, schedule, and risk restrictions requiring compromise
- ✖ System usability required during implementation
- ✖ Each evolution:
  - + Marginally closer to the end state architecture
  - + Offers value commensurate with cost
  - + Achievable/pragmatic
  - + Lowest risk critical path

**QUESTIONS?**

---
